

Visual Studio Code for Ubuntu

<https://gogs.elic.ucl.ac.be/pbarriat/learning-vscode>

Pierre-Yves Barriat

ACELI Training Sessions March 26th, 2024

What is Visual Studio Code ?

Visual Studio Code (VS Code) is a lightweight but powerful source code editor which runs on your desktop and is available for Windows, macOS and Linux.

It has a rich ecosystem of extensions for languages (such as C++, Fortran, Java, Python, etc) and runtimes (Git, Jupyter, etc)

VSC is one of the most popular and powerful text editors used by software engineers today

free, open-source and [available](#) for macOS, Windows and Linux 👍

VS Code

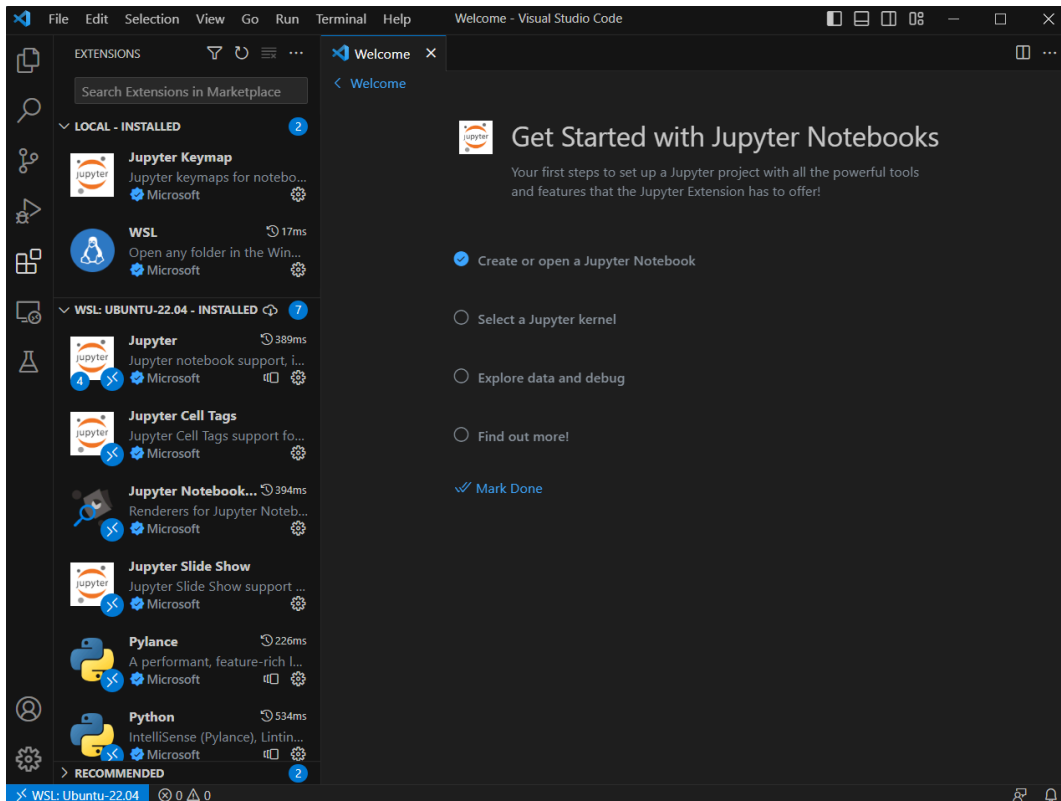

You can install Visual Studio Code from the web link [here](#)

```
wget the deb package then dpkg -i code*.deb
```

That's it ! 😊

Install extensions

- Python
- Jupyter

Jupyter Notebook in VS Code

Create a new Jupyter Notebook

Fill the first cell

```
import numpy as np
```

Try to run the cell

you must choose a Python environment first (Python 3.6)

If ✨ ... maybe you must install a missing extension !

So open a **terminal** in VS Code and do

```
sudo apt install python3-pip
```

Now, install the missing Python extension ...

```
pip instal numpy
```

The screenshot shows the Visual Studio Code interface with a Jupyter Notebook open. The notebook cell contains the code `import numpy as np`. The terminal at the bottom shows the command `pip install numpy` being executed, with output indicating the successful installation of numpy-1.24.3. The status bar at the bottom left shows 'WSL: Ubuntu-22.04'.

```
Setting up python3-dev (3.10.6-1~22.04) ...  
Processing triggers for man-db (2.10.2-1) ...  
Processing triggers for libc-bin (2.35-0ubuntu3.1) ...  
pbarrist@PC-180-119:~$ pip install numpy  
Defaulting to user installation because normal site-packages is not writeable  
Collecting numpy  
  Downloading numpy-1.24.3-cp310-cp310-manylinux_2_17_x86_64.manylinux2014_x86_64.whl (17.3 MB)  
    17.3/17.3 MB 8.6 MB/s eta 0:00:00  
Installing collected packages: numpy  
  WARNING: The scripts f2py, f2py3 and f2py3.10 are installed in '/home/pbarrist/.local/bin' which is not on PATH.  
  Consider adding this directory to PATH or, if you prefer to suppress this warning, use --no-warn-script-location.  
Successfully installed numpy-1.24.3  
pbarrist@PC-180-119:~$
```

... and run the cell again: great, it's OK now 😊

Let's try a full notebook example

Install Git : `sudo apt install git -y`

Now clone this **Git repository**

```
git clone https://forge.uclouvain.be/barriat/learning-vscode.git
```

You don't already know what's Git ?

Shame on you ! 🙄

It's not to late: take a look here

https://gogs.elic.ucl.ac.be/TECLIM/Git_Training

Now open the file `example.ipynb`

The first cell implies you must install some requirements

To run this example, install the extensions below

```
pip install netCDF4  
sudo apt install libgeos-dev libgdal-dev  
pip install cartopy
```

Now, try to run all the cells of this notebook !

VS Code nice extensions

- `Tabnine` : code faster with AI code completions
- `Regex Previewer` : shows the current regular expression's matches
- `Modern Fortran` : Fortran syntax is missing in built-in version

Visual Studio Code for Ubuntu
